

PAVEMENT RESTORATION – ASPHALT REJUVENATION PROCESS

We are contracted by the City of Boulder to work on your streets – Before we begin work, we wanted to share some information with you about our asphalt rejuvenation process. -

- **Our product is designed to restore and rejuvenate streets, which can extend their life.**
- **We use a three stage process to apply our product:**
 - 1) **We apply an oil based emulsion by distributor truck, which penetrates the asphalt in 30-40 mins;**
 - 2) **We then apply a layer of washed concrete sand on top of the emulsion to minimize any tracking of the emulsion onto stone or concrete driveways; and**
 - 3) **We sweep the street the next day.**
- **Please remove parked cars from the street during the day of product application and the following day of street sweeping.**
 - **No parking signs will be posted in advance of the work.**
- **We will only work on half of the street at a time so that residents will always have access to their street.**
- **Work is usually completed on any one street in 40-70 minutes.**
- **The application of the emulsion looks messy but will look markedly better after it is sanded and swept the following day.**
 - **Within a few weeks the appearance of the road will revert back to its original coloring.**
- **Our product will not penetrate concrete or stone so if any tracking occurs, it will burn off (oxidize) within 2-3 weeks through natural weathering.**
 - **If possible, do not drive over treated areas until sanded.**
- **Our environmentally friendly product is approved by the Environmental Protection Agency (EPA) and is not harmful to pets, wildlife, plants or gardens.**
- **Please keep children and pets off treated surfaces to avoid tracking into houses. Any spots on vehicles will clean off easily with citrus based cleaners or car care products.**
